E-Saximeter
The essential device for accurate blow counting

The E-Sax is used by piling inspectors everywhere to generate a complete Pile Driving Log, including:

- Pile name
- Start and stop driving times
- Blow count versus depth
- Blows per minute
- Final equivalent blow count for the last 20 blows
- Stroke of open end diesel hammers
- Potential energy of open end diesel hammers

Blow Count Versus Depth and Time
A sound recognition device detects and counts all hammer blows. Background noise is managed through manual or automatic adjustment of the sound level at which a blow is detected. The E-Saximeter (E-Sax) operator indicates the start of driving through the keypad, and the E-Sax stores the number of hammer blows per time increment, yielding Blows Per Minute (BPM).

The operator enters starting depth and depth increment through the E-Sax keypad. As the pile is driven, the operator pushes a button for each depth increment of penetration and the E-Sax stores the number of hammer blows per depth increment.

Stroke and Potential Energy
For open end diesel hammers, the E-Saximeter computes stroke from the measured (BPM). The hammer stroke is then multiplied by ram weight to yield hammer potential energy.

Features
- Entirely wireless
- Easy to read screen
- Calculator type keypad input
- Computer interface

E-Saximeter with antenna receives energy and depth data from wireless transmitters.

*The essential device for accurate blow counting*

**OPTIONAL ENHANCEMENTS:**

**DEPTH MEASUREMENT**
A depth sensor installed on the hammer leads replaces operator entry of depth of penetration to completely automate the generation of a pile driving log. The depth sensor tracks the movement of the hammer. A wireless transmitter sends depth of penetration information to the E-Sax.

**KINETIC ENERGY MEASUREMENT**
A pair of proximity switches mounted on the hammer detects the ram position at two points, just before ram impact. Ram position and time information are used to calculate impact velocity. A wireless transmitter sends the velocity information to the E-Saximeter, that in turn calculates the Hammer Kinetic Energy (KE) just before impact using velocity ($v^2$) and ram mass ($m_R$) information: $KE = \frac{1}{2} m_R v^2$.

Hammer Kinetic Energy is a fundamental quantity for those performing Wave Equation analysis of Pile Driving (GRLWEAP software program). The ratio of Hammer Kinetic Energy to the manufacturer’s rated energy is the Hammer Efficiency. A Pile Driving Analyzer® can determine the energy actually transferred to the pile.

---

**E-Saximeter Specifications**
- **Size:** 100 mm x 190 mm x 50 mm
- **Weight:** 700 g, including rechargeable batteries
- **Temperature range:** -10°C to +50°C
- **Battery:** internal, rechargeable, 8 hour duration
- **Internal microphone:** 70 to 115 dB
- **Maximum blow detection rate:** 68 bpm for open end diesel hammers; 300 bpm for all others
- **Maximum transmission distance with optional depth / energy enhancements:** 60 m
- **Range of optional depth sensor:** 49 m
